TEXT

When I was 21, I came to live in London. I shared a tiny basement flat with a beautiful ex-art student from Brighton. Her name was Sam. She had long brown hair and a slim figure that I was madly jealous of. She ate three chocolate bars for breakfast every morning.

I used to lie in bed looking at her eating and getting dressed, wondering how she could possibly consume so much sugar without losing her teeth, her figure or her complexion. She'd put her make-up in under a minute, put on whatever clothes happened to be lying around the room, and rush off to work looking like a model on the cover of a fashion magazine. Like me, she was just an art teacher in a secondary school.

I, on the other hand, used to put on weight if I even smiled at a bar of chocolate. I'd already lost several upper teeth, my face was spotty and I looked like a heavyweight boxer whatever I wore.

My morning reaction to Sam was always the same: I'd shut my eyes, pull the blankets over my head and force myself back to sleep. I knew that I really ought to get up too, and make use of the early start to have a shower, iron my blouse and eat something for breakfast. But I have never been what you'd call a morning person, so, as a rule, I overslept and was late for work practically every single day of the week.

TEXT

Scientists are finally beginning to unlock the secret everyone has been dying to know: just how long can we live? They confidently predict that by the end of the century people will be living to the incredible age of 130. And this is just the start.

Experts studying the process of ageing believe it is possible that people will be living long enough to have great-great grandchildren. There are around 4000 people over the age of 100 in Britain –ten times more than 30 years ago.

A century ago average life expectancy in Europe was 45. Today, providing we look after ourselves, drive our cars carefully, and cut down on things like butter, alcohol and cigarettes, we can add nearly 30 years to that figure. But that is nothing compared to what will happen once scientists have discovered our genetic secrets.

Scientists also believe that as life expectancy increases, so will other expectations. Women will be having babies at an older age, for instance.

And what about living forever? Will eternal life ever become a reality? So far, that is science-fiction, but theoretically it is possible, although it will be another hundred, perhaps two hundred years, before we know all the secrets of our genes.
